Currently, I can only create a simple template with h1, h2 and h3 tags. But, I want a template that can automatically generate the HTML code when I input the title and the description. It is something like this. For example, if I input title = 'Shopping' and description = 'Buying a gift', it will show ShoppingBuying a gift How to create this kind of template? A: You might want to check out Liquid, which is included with Rails by default. You can use liquid tags (included in the default application template) to dynamically generate the HTML for any partial. Auditory information processing in communication. The communication process is frequently the prime focus in audiological assessment, but what are the underlying principles of auditory signal processing in communication? The dynamic nature of communication leads to the need for rapid changes in direction and intensity. Signal processing in hearing is carried out rapidly, with a time constant of approximately 10 ms, but often continues for longer than this, and signal changes will continue to occur during this time. Changes in direction and intensity result in stimulation of three separate areas of the cochlea: the auditory nerve, the auditory-nerve spiral ganglion cells, and the auditory-nerve fibers within the auditory nucleus of the brainstem. The input to the three areas is different, due to both peripheral and central influences. As a result, different strategies must be employed to ensure that the auditory system is able to extract relevant information from the incoming stimuli. This paper focuses on issues related to peripheral and central processing in audition, and the important interactions between these processes in the generation of the sound-induced electric potentials 82157476af
